| <b>Question</b> | Identify the role of a firewall in an organization.                                                                                                                                                                                                                        |  |
| <b>Marks</b>    | 2                                                                                                                                                                                                                                                                          |  |
| <b>Paper</b>    | 1 — 4 5 2026, final.pdf                                                                                                                                                                                                                                                    |  |
| <b>Answer</b>   | A firewall is a hardware/software security barrier that monitors traffic between an internal network and outside networks. It blocks unauthorized or suspicious traffic using security rules. Example: a company uses it to protect private systems from Internet attacks. |  |

#### PYQ 2

|                 |                                                                                                                                                                                                    |  |

| <b>Question</b> | Define spoofing and denial-of-service attack.                                                                                                                                                      |  |
| <b>Marks</b>    | 2                                                                                                                                                                                                  |  |
| <b>Paper</b>    | 1 — 4 5 2026, final.pdf                                                                                                                                                                            |  |
| <b>Answer</b>   | Spoofing means pretending to be a trusted user/system/IP address to gain access or mislead users. A DoS attack floods a server or network with traffic so genuine users cannot access the service. |  |

#### PYQ 3

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | Explain blockchain technology and its benefits. Demonstrate how it can be applied to secure supply chain processes in a B2B e-commerce platform.                                                                                                                                                                                                                                                                                                                                                                       |  |
| <b>Marks</b>    | 10                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |
| <b>Paper</b>    | 1 — 4 5 2026, final.pdf                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |
| <b>Answer</b>   | Blockchain is a distributed, immutable ledger where verified transactions are stored in linked blocks. Benefits include transparency, traceability, tamper resistance, no single point of control, and trust between parties. In a B2B supply chain, supplier orders, shipment status, product origin, quality checks, invoices, and payments can be recorded on blockchain. This reduces fraud, counterfeiting, disputes, and unauthorized changes. Smart contracts can automate payment after delivery confirmation. |  |

| <b>Question</b> | Discuss why data security and access control would be important for Stellar Textiles when adopting integrated information systems.                                                                                                                                                                     |  |
| <b>Marks</b>    | 2.5                                                                                                                                                                                                                                                                                                    |  |
| <b>Paper</b>    | 2 — 25 11 2025, re.pdf                                                                                                                                                                                                                                                                                 |  |
| <b>Answer</b>   | Integrated systems store sales, inventory, production, finance, and customer data in one place. Data security prevents leakage or misuse of this sensitive information. Access control ensures only authorized employees can view or change data. This reduces fraud, errors, and business disruption. |  |

| <b>Paper</b>    | 2 — 25 11 2025, re.pdf                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |
| <b>Answer</b>   | Major threats include malware, phishing, spoofing, DoS/DDoS, insider misuse, SQL injection, ransomware, weak passwords, outdated software, and third-party risks. Their impact includes data loss, downtime, financial loss, privacy violation, reputational damage, legal penalties, and loss of customer trust. Firms should use firewalls, encryption, access control, 2FA, backups, patching, risk assessment, security policy, audits, and employee training. |  |

| <b>Question</b> | XYZ Bank case: What strategies should the bank employ to keep software and systems up-to-date while minimizing service disruptions? How can known vulnerabilities in legacy systems be identified and patched?                                                                                                                                                                        |  |
| <b>Marks</b>    | 5                                                                                                                                                                                                                                                                                                                                                                                     |  |
| <b>Paper</b>    | 3 — 7 2 2024, re.pdf                                                                                                                                                                                                                                                                                                                                                                  |  |
| <b>Answer</b>   | The bank should maintain a patch-management schedule, test updates in a staging environment, use phased rollout, keep backups, and schedule updates during low-traffic periods. Legacy vulnerabilities can be found using vulnerability scanning, penetration testing, vendor advisories, security audits, and asset inventory. Critical patches should be prioritized based on risk. |  |

| <b>Paper</b>    | 3 — 7 2 2024, re.pdf                                                                                                                                                                                                                                                                                                                                                          |  |
| <b>Answer</b>   | Before selecting vendors, the bank should check security certifications, privacy policies, past breaches, compliance record, access controls, and data-handling practices. Contracts should include SLA, audit rights, breach notification, encryption, and confidentiality clauses. Ongoing monitoring should include audits, reports, access reviews, and incident testing. |  |

| <b>Paper</b>    | 3 — 7 2 2024, re.pdf                                                                                                                                                                                                                                                                                                                                                                                          |  |
| <b>Answer</b>   | An information system performs input, processing, output, storage, and feedback. Input collects raw data, processing converts it into meaningful information, output provides reports/alerts, storage saves data for later use, and feedback improves future decisions. Computer crime is illegal activity involving computers. Examples where computers are targets include malware attacks and DoS attacks. |  |

| <b>Question</b> | Explain how two-factor authentication can help reduce fraud and security breaches.                                                                                                                                                             |  |
| <b>Marks</b>    | 2                                                                                                                                                                                                                                              |  |
| <b>Paper</b>    | 5 — 24 11 2023, final.pdf                                                                                                                                                                                                                      |  |
| <b>Answer</b>   | Two-factor authentication uses two proofs of identity, such as password plus OTP/biometric. Even if a password is stolen, the attacker cannot easily access the account without the second factor. This reduces fraud and unauthorized access. |  |

| <b>Question</b> | ABC Manufacturing MIS failure case: What security measures should have been in place to prevent data breaches within the MIS? How can the company rebuild trust and ensure the security of sensitive data after a breach?                                                                                           |  |
| <b>Marks</b>    | 5                                                                                                                                                                                                                                                                                                                   |  |
| <b>Paper</b>    | 5 — 24 11 2023, final.pdf                                                                                                                                                                                                                                                                                           |  |
| <b>Answer</b>   | The company should have used role-based access, encryption, 2FA, firewalls, audit logs, backups, and regular security testing. After a breach, it should notify affected parties, investigate the cause, patch weaknesses, reset credentials, improve controls, and communicate corrective action to rebuild trust. |  |

| <b>Question</b> | Cloud migration case: Analyze the decision problem with stakeholder conflicts.                                                                                                                                                                                                                                             |  |
| <b>Marks</b>    | 5                                                                                                                                                                                                                                                                                                                          |  |
| <b>Paper</b>    | 1 — 4 5 2026, final.pdf                                                                                                                                                                                                                                                                                                    |  |
| <b>Answer</b>   | The CTO wants cloud for scalability and flexibility. The CFO worries about TCO, recurring costs, and vendor lock-in. The security team worries about privacy and compliance. Competitors using hybrid cloud are scaling faster. The decision conflict is between growth, cost control, security, and competitive pressure. |  |

|                 |                                                                                                                                                                                                                                                                                       |  |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | Cloud migration case: Keeping competition in mind, how should the company move forward?                                                                                                                                                                                               |  |
| <b>Marks</b>    | 5                                                                                                                                                                                                                                                                                     |  |
| <b>Paper</b>    | 1 — 4 5 2026, final.pdf                                                                                                                                                                                                                                                               |  |
| <b>Answer</b>   | The firm should adopt a hybrid or multi-cloud strategy. Critical/private data can remain in private cloud while scalable workloads move to public cloud. It should calculate TCO, negotiate SLA, use encryption and access control, avoid deep vendor lock-in, and migrate in phases. |  |

### PYQ 3

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |

| <b>Question</b> | Analyze how the evolution of computing technologies has influenced organizations.                                                                                                                                                                                                                                                                                                                                                                                                         |  |
| <b>Marks</b>    | 10                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |
| <b>Paper</b>    | 1 — 4 5 2026, final.pdf                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |
| <b>Answer</b>   | Mainframes centralized computing and control. PCs improved individual productivity. Client-server systems connected departments. Enterprise systems integrated processes. Cloud/mobile enabled remote work and scalability. Big data and AI improved analytics and automation. These changes flattened organizations, widened spans of control, redistributed power through information access, improved supervision through dashboards, and made decision-making faster and data-driven. |  |

| <b>Paper</b>    | 2 — 25 11 2025, re.pdf                                                                                                                                                                                                                                                                                                                                                                                                                                       |  |
| <b>Answer</b>   | Major trends include mobile digital platforms, virtualization, cloud computing, edge computing, green computing, quantum computing, and consumerization/BYOD. Virtualization lets one physical server run many virtual machines, reducing cost. Cloud provides on-demand scalable infrastructure. Edge computing processes data near the source, reducing latency for IoT and real-time decisions. These improve flexibility, cost control, and performance. |  |

|                 |                                                                                                                                                                                                                                                                     |  |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | Even mid-size corporates have started adopting cloud-based platforms. Discuss/justify the reasons.                                                                                                                                                                  |  |
| <b>Marks</b>    | 5                                                                                                                                                                                                                                                                   |  |
| <b>Paper</b>    | 4 — 30 Jan 2023, re.pdf                                                                                                                                                                                                                                             |  |
| <b>Answer</b>   | Cloud reduces upfront hardware cost, offers scalability, enables remote access, speeds deployment, and provides pay-as-you-use pricing. Mid-size firms also benefit from automatic updates, disaster recovery, and access to advanced tools without large IT teams. |  |

| <b>Question</b> | UPMC case: Assess the impact of the IT infrastructure situation on business performance.                                                                                                                                            |  |
| <b>Marks</b>    | 4                                                                                                                                                                                                                                   |  |
| <b>Paper</b>    | 4 — 30 Jan 2023, re.pdf                                                                                                                                                                                                             |  |
| <b>Answer</b>   | Separate servers for every application increase cost, complexity, downtime, and maintenance effort. Multiple OS versions and vendors create integration problems. This reduces flexibility, slows service delivery, and raises TCO. |  |

| <b>Paper</b>    | 4 — 30 Jan 2023, re.pdf                                                                                                                                                                                                                                       |  |
| <b>Answer</b>   | Consolidate servers, use virtualization, standardize platforms, move suitable workloads to cloud, renegotiate vendor contracts, automate monitoring, and improve capacity planning. These reduce hardware, maintenance, energy, training, and downtime costs. |  |

| <b>Paper</b>    | 5 — 24 11 2023, final.pdf                                                                                                                                                                                                                                                                                                                                  |  |
| <b>Answer</b>   | Green computing reduces energy use, cooling cost, carbon footprint, and e-waste. It improves corporate image and may support compliance. Multicore processors increase performance by using multiple processing cores on one chip while saving power. Together they improve efficiency, lower operating cost, and support sustainable business operations. |  |

| <b>Paper</b>    | 5 — 24 11 2023, final.pdf                                                                                                                                                                                                                                                                    |  |
| <b>Answer</b>   | Firms manage hardware, operating systems, enterprise software, DBMS, networking, Internet platforms, data centers, cloud services, and consulting/SI services. Example: an e-commerce firm needs servers, Linux/Windows, ERP/CRM, database, routers, cloud hosting, and integration support. |  |

| <b>Paper</b>    | 6 — 18 11 2022, final.pdf                                                                                                                                                                                                                             |  |
| <b>Answer</b>   | Moore's Law says microprocessor power doubles roughly every 18-24 months while cost falls. The Law of Mass Digital Storage says digital storage capacity grows rapidly while storage cost falls. Both explain cheaper and more powerful IT over time. |  |

| <b>Paper</b>    | 2 — 25 11 2025, re.pdf                                                                                                                                                                                                                                                                                                                                                                                |  |
| <b>Answer</b>   | The KM value chain shows how knowledge creates business value. Stages are acquisition, storage, dissemination, and application. Acquisition captures tacit/explicit knowledge. Storage saves it in repositories/databases. Dissemination shares it through portals, wikis, search, and collaboration tools. Application uses knowledge for decisions, products, processes, and competitive advantage. |  |

### PYQ 4

| <b>Paper</b>    | 4 — 30 Jan 2023, re.pdf                                                                                                                                                                                                                                                                                     |  |
| <b>Answer</b>   | Knowledge workers create, analyze, and apply knowledge for innovation and decision-making. They design products, solve complex problems, improve processes, and use KWS tools like CAD, analytics, VR, and expert systems. Their most critical role is innovation because it creates competitive advantage. |  |

| <b>Paper</b>    | 5 — 24 11 2023, final.pdf                                                                                                                                                                                                                                                                                                                                                |  |
| <b>Answer</b>   | Netflix collects viewing, rating, search, device, and behavior data. It processes this data using analytics and machine learning to find patterns and recommend content. Feedback from user choices improves future recommendations. Amazon/AWS helps Netflix store and process large-scale data through scalable cloud infrastructure, storage, and computing services. |  |

| <b>Answer</b>   | ERP benefits include integrated data, standard processes, better reporting, cost control, and improved coordination. Challenges include high cost, complexity, user resistance, customization, data migration, and training. Failures occur due to poor requirements, weak management support, lack of user involvement, poor data quality, and inadequate change management. |  |

| <b>Answer</b>   | A supply chain is a network of suppliers, manufacturers, distributors, retailers, and customers. Each downstream customer becomes a supplier to the next stage. Flow includes materials, information, and payments. Simple diagram: Raw material supplier -> Manufacturer -> Distributor -> Retailer -> Final customer. SCM improves visibility, planning, inventory control, and delivery. |  |

| <b>Paper</b>    | 5 — 24 11 2023, final.pdf                                                                                                                                                                                                                                                                          |  |
| <b>Answer</b>   | The bullwhip effect occurs when small demand changes at customer level become larger fluctuations up the supply chain. It is common in retail/manufacturing supply chains. It can be controlled through real-time data sharing, demand planning, vendor-managed inventory, and pull-based systems. |  |

| <b>Question</b> | Key characteristics of enterprise applications and four common applications.                                                                                                              |  |
| <b>Marks</b>    | 5                                                                                                                                                                                         |  |
| <b>Paper</b>    | 6 — 18 11 2022, final.pdf                                                                                                                                                                 |  |
| <b>Answer</b>   | Enterprise applications span departments, integrate processes, use common databases, and support organization-wide coordination. The four common applications are ERP, SCM, CRM, and KMS. |  |

## Unit 9 - E-Commerce and EDI

### PYQ 1

|                 |                                                                                                                                                                                                                                                                                                                                |  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | Discuss five ways e-commerce revolutionized marketing with examples.                                                                                                                                                                                                                                                           |  |
| <b>Marks</b>    | 10                                                                                                                                                                                                                                                                                                                             |  |
| <b>Paper</b>    | 1 — 4 5 2026, final.pdf                                                                                                                                                                                                                                                                                                        |  |
| <b>Answer</b>   | E-commerce changed marketing through personalization, behavioral targeting, social media marketing, mobile/location-based marketing, global reach, interactivity, and lower campaign cost. Example: Amazon recommends products, Google uses search ads, Instagram supports social commerce, and food apps use location offers. |  |

### PYQ 2

|                 |                                                                                                                                                                                                                                                                                                             |  |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | Explain transaction fee, subscription, free/freemium, and sales revenue models.                                                                                                                                                                                                                             |  |
| <b>Marks</b>    | 10                                                                                                                                                                                                                                                                                                          |  |
| <b>Paper</b>    | 1 — 4 5 2026, final.pdf                                                                                                                                                                                                                                                                                     |  |
| <b>Answer</b>   | Transaction fee model earns commission per transaction, e.g., PayPal or Booking.com. Subscription model earns recurring fees, e.g., Netflix. Freemium gives basic service free and charges for premium features, e.g., Dropbox. Sales model earns revenue from direct sale of goods/services, e.g., Amazon. |  |

### PYQ 3

|                 |                                                                                                                                                                                                                                                                                                                               |  |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | Explain concept and types of e-commerce. Discuss any three revenue models.                                                                                                                                                                                                                                                    |  |
| <b>Marks</b>    | 10                                                                                                                                                                                                                                                                                                                            |  |
| <b>Paper</b>    | 2 — 25 11 2025, re.pdf                                                                                                                                                                                                                                                                                                        |  |
| <b>Answer</b>   | E-commerce is buying and selling goods/services using Internet and web technologies. Types include B2C, B2B, C2C, and m-commerce. Revenue models include sales, subscription, transaction fee, advertising, affiliate, and freemium. Example: Amazon uses sales, Netflix uses subscription, and PayPal uses transaction fees. |  |

### PYQ 4

|                 |                                                                                                                                          |  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | What documents are commonly exchanged in EDI?                                                                                            |  |
| <b>Marks</b>    | 2                                                                                                                                        |  |
| <b>Paper</b>    | 4 — 30 Jan 2023, re.pdf                                                                                                                  |  |
| <b>Answer</b>   | Common EDI documents include purchase orders, invoices, shipping notices, payment documents, order confirmations, and inventory reports. |  |

### PYQ 5

|                 |                                                                                                                                                                                                                                                                                              |  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | E-commerce has limitations. Identify four limitations.                                                                                                                                                                                                                                       |  |
| <b>Marks</b>    | 10                                                                                                                                                                                                                                                                                           |  |
| <b>Paper</b>    | 5 — 24 11 2023, final.pdf                                                                                                                                                                                                                                                                    |  |
| <b>Answer</b>   | Limitations include security/privacy risks, lack of physical inspection, delivery delays, dependence on Internet/payment systems, fraud risk, return problems, and trust issues. Firms reduce these through secure payments, clear return policies, reviews, tracking, and customer support. |  |

### PYQ 6

|                 |                                                                                                                          |  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | Major advantages of shopping online.                                                                                     |  |
| <b>Marks</b>    | 2                                                                                                                        |  |
| <b>Paper</b>    | 6 — 18 11 2022, final.pdf                                                                                                |  |
| <b>Answer</b>   | Online shopping offers convenience, 24/7 access, wider choice, price comparison, home delivery, and personalized offers. |  |

## Unit 6 - Databases, Data Warehouse, BI Data

### PYQ 1

|                 |                                                                                                                                                                                                                                                                                                                                                   |  |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | Explain key capabilities of modern database systems and importance of RDBMS.                                                                                                                                                                                                                                                                      |  |
| <b>Marks</b>    | 10                                                                                                                                                                                                                                                                                                                                                |  |
| <b>Paper</b>    | 2 — 25 11 2025, re.pdf                                                                                                                                                                                                                                                                                                                            |  |
| <b>Answer</b>   | Modern DBMS provides data definition, data dictionary, querying through SQL, reporting, security, access control, backup, and multiple views. RDBMS stores data in tables using rows and columns with primary and foreign keys. It reduces redundancy, improves consistency, supports queries, and helps manage business information efficiently. |  |

| <b>Question</b> | Explain subject-oriented, integrated, time-variant, and non-volatile data warehouse.                                                                                                                                                                                               |  |
| <b>Marks</b>    | 5                                                                                                                                                                                                                                                                                  |  |
| <b>Paper</b>    | 4 — 30 Jan 2023, re.pdf                                                                                                                                                                                                                                                            |  |
| <b>Answer</b>   | Subject-oriented means data is organized by topics such as sales/customers. Integrated means data from different systems is standardized. Time-variant means historical data is stored for trend analysis. Non-volatile means data is stable/read-only and not frequently changed. |  |

| <b>Question</b> | Describe the core activities of system development.                                                                                                                                                                                                                                                                                 |  |
| <b>Marks</b>    | 10                                                                                                                                                                                                                                                                                                                                  |  |
| <b>Paper</b>    | 3 — 7 2 2024, re.pdf                                                                                                                                                                                                                                                                                                                |  |
| <b>Answer</b>   | Core activities are systems analysis, systems design, programming, testing, conversion, and production/maintenance. Analysis defines problems and requirements. Design specifies the solution. Programming creates software. Testing checks correctness. Conversion shifts to the new system. Maintenance improves it after launch. |  |

| <b>Marks</b>    | 10                                                                                                                                                                                                                                                          |  |
| <b>Paper</b>    | 5 — 24 11 2023, final.pdf                                                                                                                                                                                                                                   |  |
| <b>Answer</b>   | BPR steps include identifying processes for change, analyzing existing processes, designing the new process, implementing the redesigned process, and continuously measuring performance. It aims to remove delays, duplication, and non-value-adding work. |  |

## Unit 4 - Organizations, Strategy, Porter, Virtual Organization

### PYQ 1

|                 |                                                                                                                                                                                                                               |  |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | Define a virtual organization and outline key benefits.                                                                                                                                                                       |  |
| <b>Marks</b>    | 2                                                                                                                                                                                                                             |  |
| <b>Paper</b>    | 1 — 4 5 2026, final.pdf                                                                                                                                                                                                       |  |
| <b>Answer</b>   | A virtual organization uses networks to link people, assets, and ideas without owning all physical resources. Benefits include flexibility, lower cost, access to external expertise, faster scaling, and wider market reach. |  |

### PYQ 2

|                 |                                                                                                                                                                                                                                                                                                                         |  |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | Using Porter's Competitive Forces Model, analyze how external forces influence performance and strategy.                                                                                                                                                                                                                |  |
| <b>Marks</b>    | 10                                                                                                                                                                                                                                                                                                                      |  |
| <b>Paper</b>    | 2 — 25 11 2025, re.pdf                                                                                                                                                                                                                                                                                                  |  |
| <b>Answer</b>   | Porter's forces are rivalry, threat of new entrants, substitutes, buyer power, and supplier power. Strong forces reduce profitability. Firms use IS for cost leadership, differentiation, customer intimacy, supplier integration, and entry barriers. Strategy should respond to the strongest forces in the industry. |  |

### PYQ 3

|                 |                                                                                                                                                                                                                                          |  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | Explain how the Internet changed competitive forces and advantage.                                                                                                                                                                       |  |
| <b>Marks</b>    | 2                                                                                                                                                                                                                                        |  |
| <b>Paper</b>    | 3 — 7 2 2024, re.pdf                                                                                                                                                                                                                     |  |
| <b>Answer</b>   | The Internet increases transparency, buyer power, and rivalry, but also enables new business models, lower transaction costs, and wider reach. Firms gain advantage through differentiation, lower cost, and customer/supplier intimacy. |  |

### PYQ 4

|                 |                                                                                                                                                                                                                        |  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | Luxury watch case: Analyze industry using Porter's Five Forces and strategic response.                                                                                                                                 |  |
| <b>Marks</b>    | 2                                                                                                                                                                                                                      |  |
| <b>Paper</b>    | 5 — 24 11 2023, final.pdf                                                                                                                                                                                              |  |
| <b>Answer</b>   | The firm should assess rivalry, new entrants, substitutes, buyer power, and supplier power. It can respond using differentiation, niche targeting, online sales, personalization, and stronger customer relationships. |  |

### PYQ 5

|                 |                                                                                                                                                                                                                                                  |  |

| <b>Question</b> | Porter's Five Forces for D-Mart/grocery chain.                                                                                                                                                                                                                                                            |  |
| <b>Marks</b>    | 5                                                                                                                                                                                                                                                                                                         |  |
| <b>Paper</b>    | 6 — 18 11 2022, final.pdf                                                                                                                                                                                                                                                                                 |  |
| <b>Answer</b>   | For grocery retail, rivalry is high, buyer power is medium/high, supplier power may be medium, substitutes are high, and new entrants face scale/cost barriers. D-Mart can improve profitability through low-cost leadership, supply-chain efficiency, customer loyalty, and strong vendor relationships. |  |

## Unit 1 and 2 - IS Basics, Strategic Objectives, IS Department

### PYQ 1

|                 |                                                                                                                                                                               |  |

| <b>Question</b> | Distinguish systems for management groups.                                                                                                                                                                       |  |
| <b>Marks</b>    | 2                                                                                                                                                                                                                |  |
| <b>Paper</b>    | 5 — 24 11 2023, final.pdf                                                                                                                                                                                        |  |
| <b>Answer</b>   | TPS supports operational staff with routine transactions. MIS supports middle managers with reports. DSS supports semi-structured decisions. ESS supports senior executives with dashboards and external trends. |  |

## Unit 3 - Business Processes, Collaboration, E-Business

### PYQ 1

|                 |                                                                                                                                                                                             |  |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | What are categories/types of business processes? Give examples.                                                                                                                             |  |
| <b>Marks</b>    | 2                                                                                                                                                                                           |  |
| <b>Paper</b>    | 4 — 30 Jan 2023, re.pdf                                                                                                                                                                     |  |
| <b>Answer</b>   | Business processes can be functional or cross-functional. Functional example: payroll in HR. Cross-functional example: order fulfillment involving sales, warehouse, shipping, and finance. |  |

### PYQ 2

|                 |                                                                                                                                                                                                                                                                                                                       |  |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Question</b> | Why is collaboration growing in importance and what are main types?                                                                                                                                                                                                                                                   |  |
| <b>Marks</b>    | 5                                                                                                                                                                                                                                                                                                                     |  |
| <b>Paper</b>    | 6 — 18 11 2022, final.pdf                                                                                                                                                                                                                                                                                             |  |
| <b>Answer</b>   | Collaboration is growing due to globalization, remote work, knowledge work, innovation, and faster decision-making. Types include informal/formal, short-term/long-term, cross-functional teams, virtual teams, and social business collaboration using tools like email, video meetings, wikis, and cloud documents. |  |
